

Budget Buddy Student Expense Tracker

Task 1 - Test Plan

Test Case ID	Scenario	Description	Test Data (Amount, Budget)	Expected Result
TC-01	Normal Expense	A student makes a standard, affordable purchase within their limit.	Amount: 50, Budget: 100	Pass (True)
TC-02	Negative Entry	A student accidentally enters a negative value or zero as an expense.	Amount: -10, Budget: 100	Fail (False)
TC-03	Over Budget	A student tries to spend more than their remaining monthly allowance.	Amount: 150, Budget: 100	Fail (False)

Task 3: Test Results Explanation

The terminal output shows three dots (...), which indicates that all three test cases I created—Normal Expense, Negative Entry, and Over Budget—passed successfully without any logic failures (which would have been marked with an **F**). The final status of **OK** confirms that the `validate_expense` function is working perfectly and is ready for the app. By passing these tests, the code successfully enforces key financial rules: it allows standard purchases, blocks negative numbers from incorrectly increasing the student's budget, and prevents students from spending more than their monthly allowance, which keeps their balance from going into the negative.
